

Tutorial

Caution:

In this tutorial we are using an example of a 'wall' mockup that we created specifically for tutorial purposes. If the mockup you're using is different from the one we used in this tutorial, don't worry. Because this tutorial focuses on editing techniques not on images.

Before going into the tutorial, you need to know that this mockup uses the 'smart object' technique in photoshop and this tutorial is only for changing or editing the mockup not for making a mockup design.

Tutorial:

1. Open the psd file that you downloaded

2. After the photoshop interface appears, open the 'design' folder

3. In the 'design' folder there is a 'smart object' layer which we named 'here'.

**we will name the layer 'here' if there is only one design content.*

But if it is more, we will name it according to the object (such as card, envelope, cover, etc.).

3. **Double click** on the 'smart object' layer.

it will automatically appear **new artwork.*

4. Create or place your design, and

5. Save your design by pressing CTRL S on the keyboard

6. Check the proportions and sizes of your designs on the **mockup artwork**.

**If the design is right, close the 'smart object' artwork.*

7. After close the 'smart object' artwork. Save your edits with 'save as' in JPG/PNG file format (PNG is recommended).

8. Select the location to save your file, then click 'save'.

9. Check the mockup image that was made earlier.

10. *Send to clients your design presentation.
